

SHA1 & SHA256 Benchmark on Raspberry Pi 5

This report summarizes benchmarking results for SHA1 and SHA256 hashing on a Raspberry Pi 5. Three implementations were measured: Rust software-only, Rust accelerated (Armv8 crypto), and the platform engine (OpenSSL EVP).

Armv8 acceleration provides major throughput gains over the software-only version, especially at larger buffer sizes. The engine implementation remains fastest overall. For small packet telemetry (<8 KiB), Rust-accel is recommended due to lower overhead. For large streaming buffers, the engine achieves maximum sustained MB/s.
